Sindh lies in a tropical to subtropical region; it is hot in the summer and mild to warm in winter. Temperatures frequently rise above 46 C (115 F) between May and August, and the minimum average temperature of 2 C (36 F) occurs during December and January in the northern and higher elevated regions. The annual rainfall averages about 7", falling mainly during July and August. The southwest monsoon wind begins to blow in mid-February and continues until the end of September, whereas the cool northerly wind blows during the winter months from October to January.

Geology of the project area comprises alluvial sediments deposited by the River Indus and consists fine to medium sands, silts clays of Pleistocene and recent epochs over a basement of tertiary rocks. The nature of the soils varies considerably from place to place and there are layers of sand belts (containing sand and sandy silt) and clay belt (containing clay and silt) spread over the area. Textures are closely related to depositional conditions and all mapping is based on geomorphic units, although, stratification is complex, the majority of soils are within the range of fine sandy loam to silt clay loams being most common. True clays and sands are rare at least in the upper alluvium. All soils contain calcium carbonate and most contain gypsum. Salinity is wide spread but generally ephemeral, with adequate water and drainage, most soils can be reclaimed by simple leaching.
